SRN: PES1UG24CS060

## 1. ACTIVE SPRINTS AND BACKLOGS

## 2. VARIATIONS OF BURNDOWN CHART

### 3) QUESTIONS

#### 1. Did your estimations reflect the actual effort?

Yes, the estimations gave us a reasonable idea of the effort required for each task. Since this was a simulated sprint, the story points helped us compare the relative complexity of the tasks and plan the sprint accordingly.

#### 2. Was your backlog well-prioritized?

Yes, the backlog was prioritized by organizing the work according to the order in which the features would be needed. The tasks related to scheduling were handled before the guest outline and production tasks, which made the workflow more logical.

#### 3. How did your simulated sprint align with your plan?

The sprint generally followed the planned structure. The stories were assigned to the sprint and grouped under their respective epics, allowing the work to be organized according to the planned features. The sprint therefore provided a clear view of what work was planned and what remained to be completed.

#### 4. What insights did the burndown chart give about your team's capacity?

The burndown chart showed the total story points assigned to the sprint and the remaining work over time. In our simulation, the chart also showed that the team had 11 story points of work at the start. This helped us understand how much work the team had taken on and would allow us to track whether the team was completing work at the expected rate.
